

A small scale projection clock

# **STARRY DAYS**

Carol Kozak

Areas of Interest

Function and form

# **PRECEDENTS & RESEARCH**

# PROBLEM:

These clocks are confusing and hard to understand and overly complicated.

Christmas lights hung on the town clock in Tredegar, UK

**INSPIRATION**

# AUDIENCE

People looking for a more organic and relaxing wall clock without big numbers and the tick-tock sound.

People who want ambient light at night (a night light) – maybe in the hall that leads to a bathroom or the kitchen. When they get up in the middle of the night they can go to the bathroom or kitchen without turning on too many (or any) additional lights. It is also a nice way to see the time when you get up in the middle of night.

People who wake up before the sun rises and want to not disturb another sleeping person. They can use the ambient light to walk down the hallway.

People who set their clocks forward so they are not late.

People who enjoy posters, art and photographs on their wall.

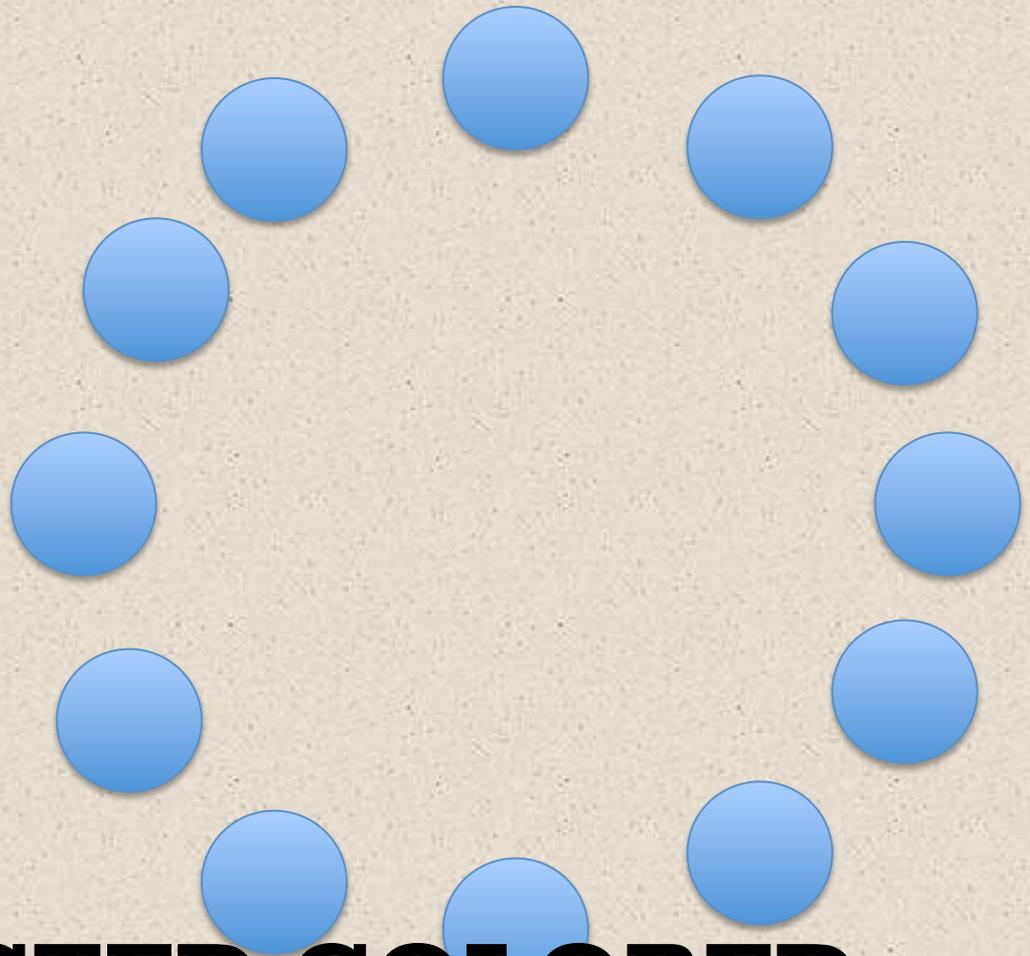

# **PROCESS & PROTOTYPES**

Brightens an LED every hour.

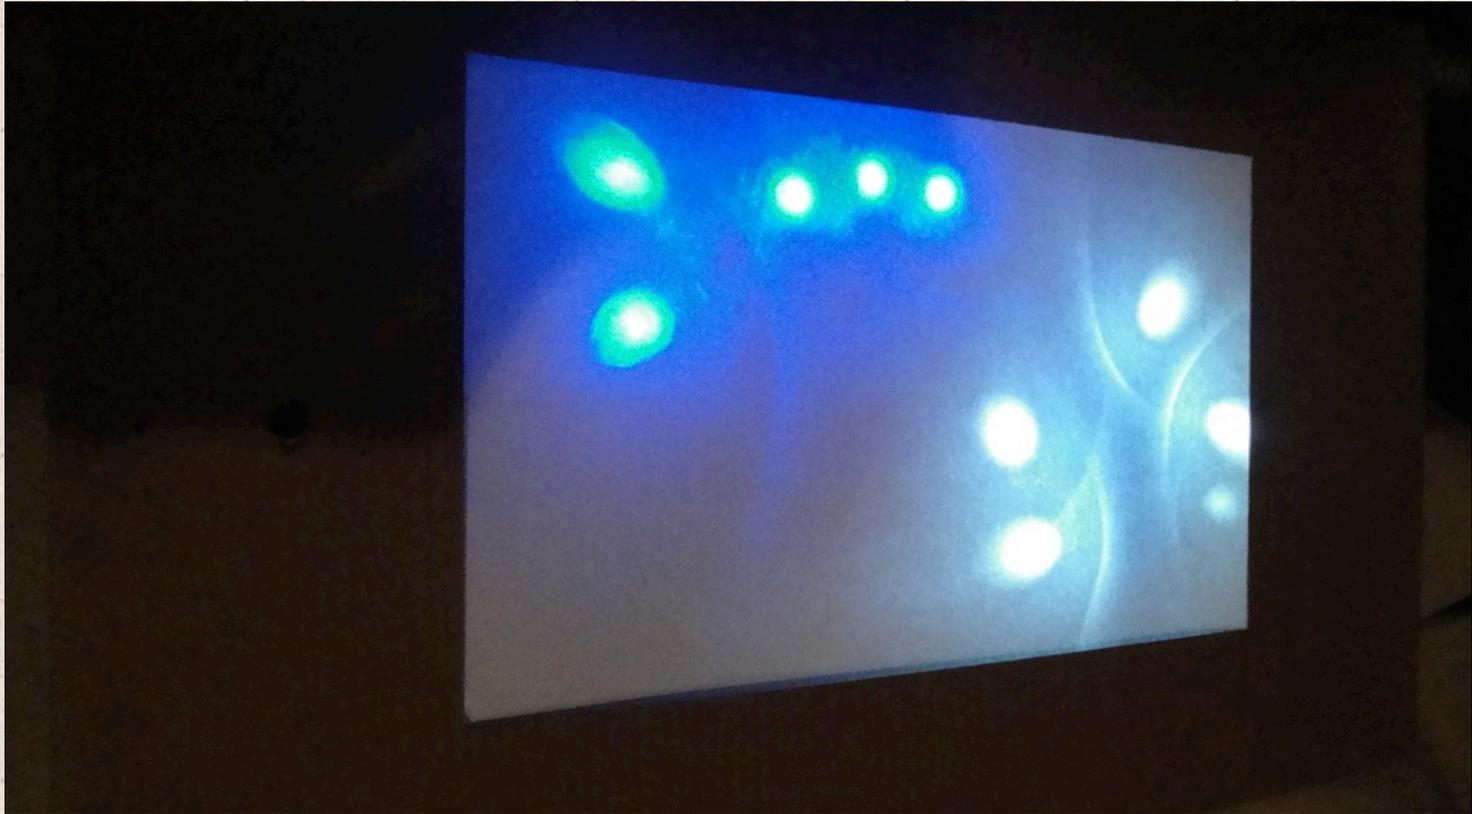

**WEARABLE**

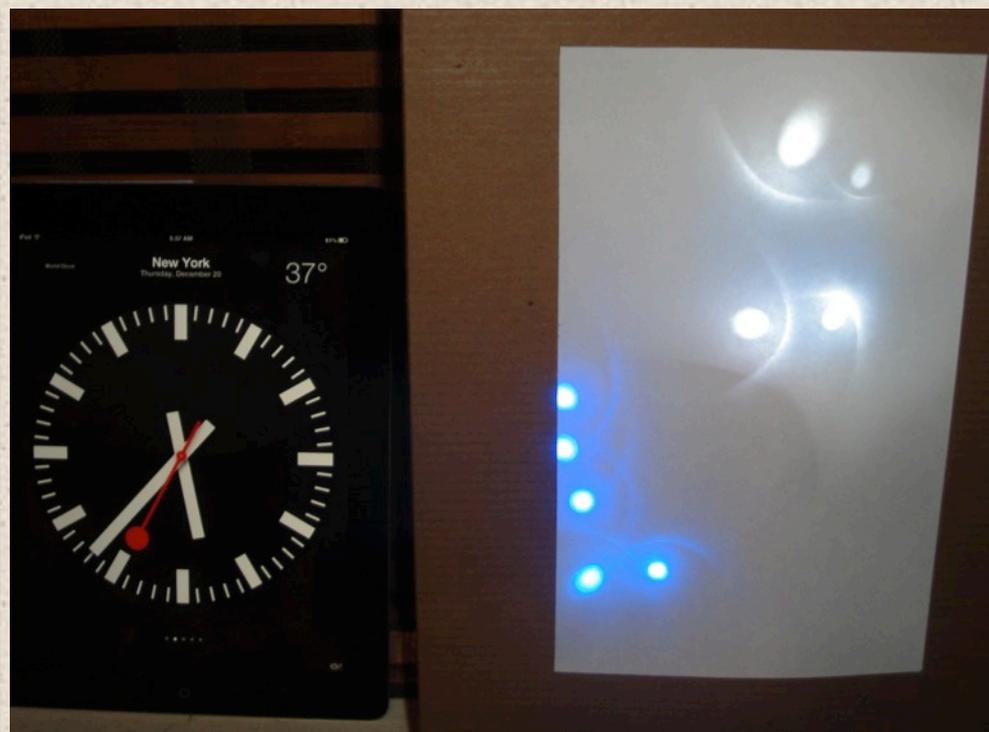

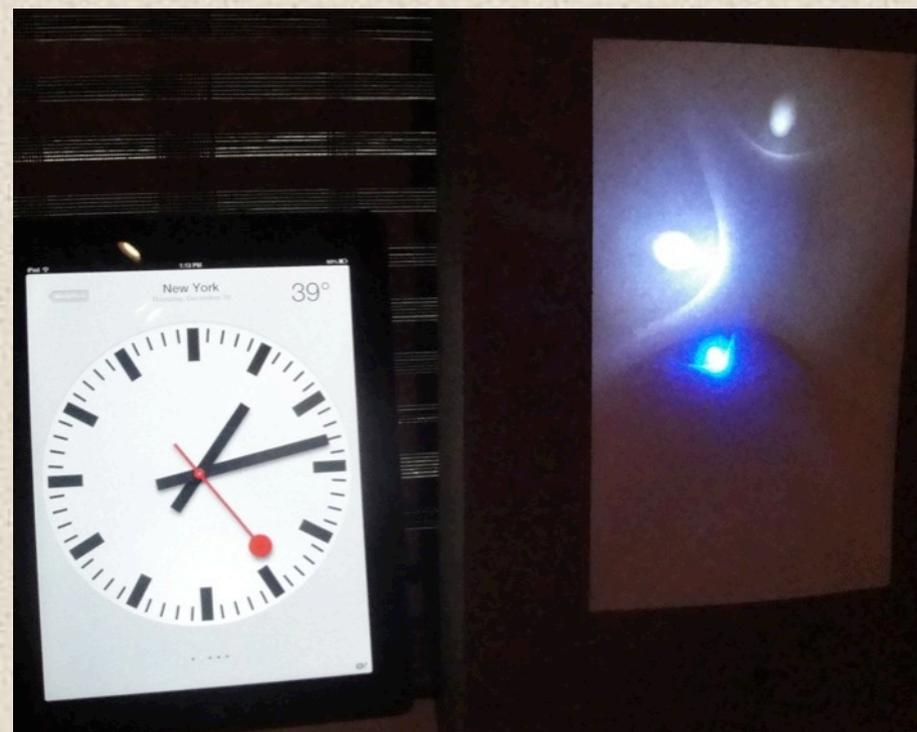

12 lights for hours

# **12 PROJECTED COLORED CIRCLES ON THE WALL**

12 lights for hours and lights for minutes

**BLUE LIGHTS FOR HOURS AND  
WHITE LIGHTS FOR MINUTES  
IN INCREMENTS OF 10**

What I learned:

A lot about components:

Reel LEDs require transistors to program.

Shift registers give you extra pins.

Buy more than you think you need!

17 LEDs makes for a lot of tangled wires so stay organized. Also when controlling the lights with the clock it is important to stay very organized in your code.

In future iterations:

I would further user test the clock to see what arrangement of lights is the best.

I would work more with the minutes flashing when the button is pressed.

And I would like to try the large projection clock again.

Thank  
you!
